# Love Canal Disaster

# Regulatory toxicology

---

- Uses scientific knowledge to develop regulations and other strategies for reducing and controlling exposure to dangerous chemicals.

Chemical Resource:

## **Cosmetics, consumer products**

- Safety assessment

## **Environmental contaminants**

- Drinking water
- outdoor/indoor air
- soil, waste sites

## **Chemicals, biocides, drugs**

- Regulation of admission, production, and use

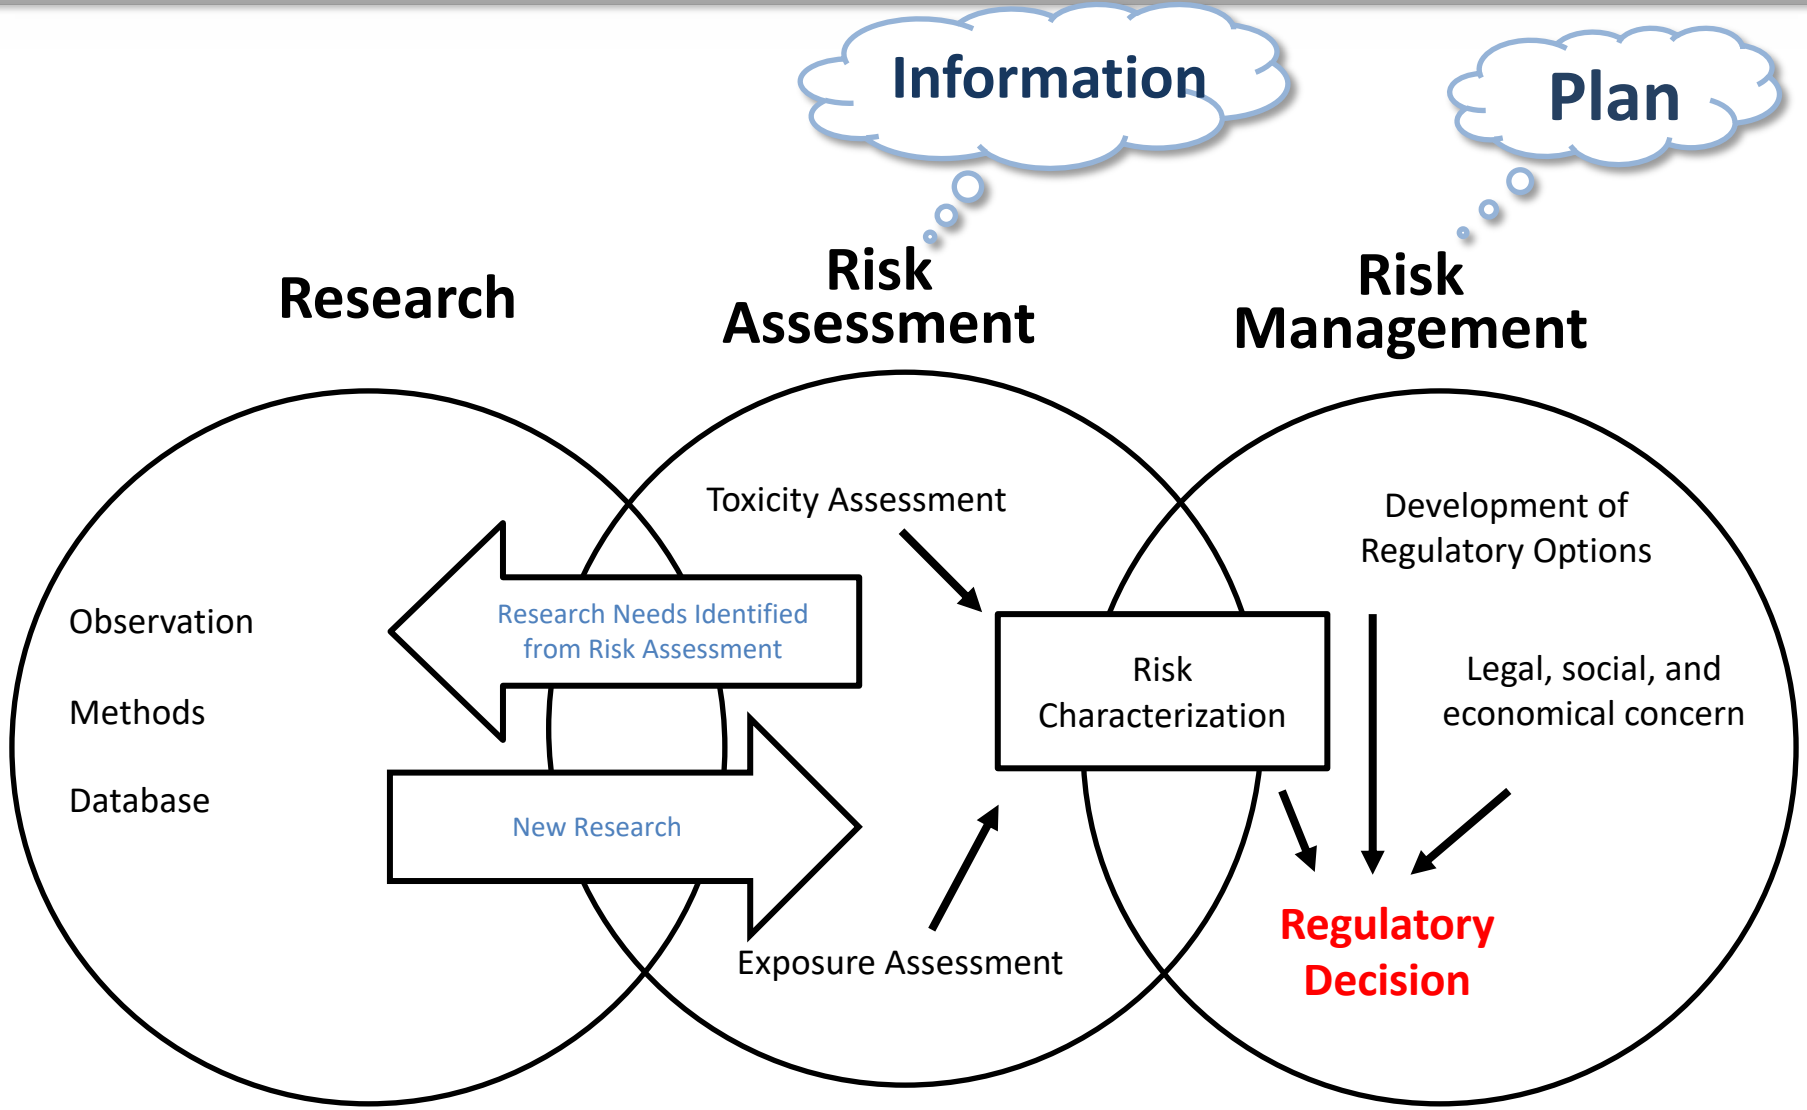

## **Food safety**

- Addictive
- Contaminants

## **Occupational safety**

- Hazardous substances at workplace

# Regulatory Process

# Step-1 Hazard Identification

- What might be harming you?

Red and  
processed meat

?

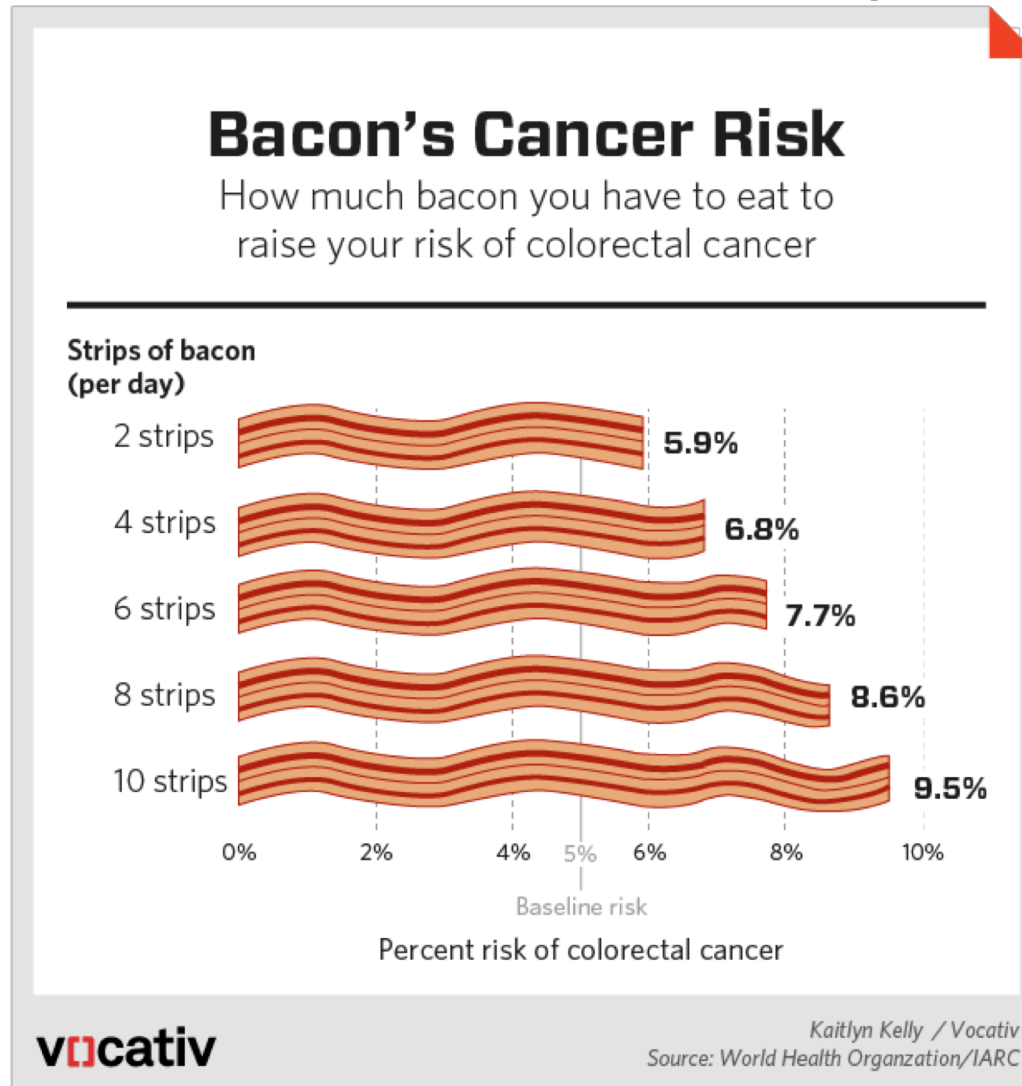

Cancer

# Step 2 Dose-Response Evaluation

- Health problems at different exposures?

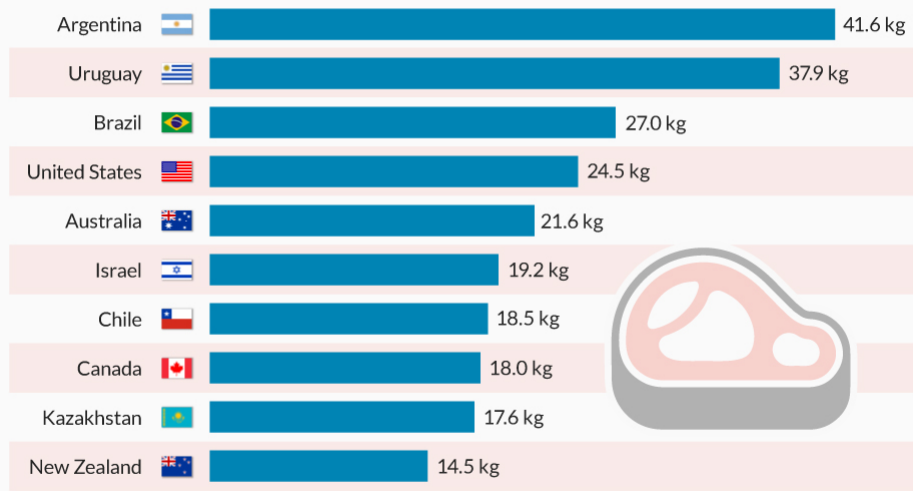

# Step 3 Exposure Assessment

- Who eats the most meat?
- How much do they eat?

## Which countries eat the most red meat?

Annual beef & veal consumption per capita in OECD countries in 2014

@StatistaCharts Source: OECD

i100 from The INDEPENDENT statista

## HOW MUCH MEAT DO YOU EAT A DAY?

HOW YOUR PROCESSED AND RED MEAT CONSUMPTION CAN ADD UP OVER A DAY...

**ENGLISH BREAKFAST**

Two sausages... **60g**  
Three rashers of bacon... **75g**

**HAM SANDWICH**

Two slices of ham... **50g**

**SPAGHETTI BOLOGNESE**

Minced beef in a regular portion... **100g**

**CUT IT DOWN**

One sausage... **30g**  
One rasher of bacon... **25g**

**SWAP IT**

Substitute ham for chicken or tuna... **0g**

**BULK IT OUT**

Use less meat and add beans or extra veggies... **15g**

285g

TOTAL EATEN

70g

RECOMMENDED DAILY LIMIT OF CONSUMPTION

# Step 4 Risk Characterization

- Is the hazard likely to harm you?

## CANCER RISK: TOBACCO VS. RED MEAT

Based on 2015 data from the Canadian Cancer Society and a study by Cancer UK, here's a look at the relative risks posed by smoking and eating red and processed meat:

☺ = 1,000 cases

\* Source: Canadian Cancer Society

\*\* Source: Based on a Cancer UK study, using Canadian data; Differences in exposure and behaviour patterns could alter this estimate.

# 4 Steps in Risk Assessment

---

## Hazard Identification

Whether a particular chemical can cause an adverse health effect in humans

- qualitative
- weight-of-evidence

## Dose-Response Assessment

Relationship between the dose of a chemical and the incidence or severity of adverse effect in exposed population

## Exposure Assessment

Determination of the amount of a chemical to which humans are exposed

## Risk Characterization

Prediction of the frequency and severity of effects in the exposed population

# Information for assessment

## LEUKÆMIA IN BENZENE WORKERS

PETER F. INFANTE  
JOSEPH K. WAGONER

ROBERT A. RINSKY  
RONALD J. YOUNG

*Industrial Hygiene Studies Branch, Division of Surveillance,  
Hazard Evaluations and Field Studies, National Institute for  
Occupational Safety and Health, Center for Disease Control,  
Cincinnati, Ohio 45202, U.S.A.*

- **Epidemiology**

- Advantage: realistic exposure in human

- Disadvantage:

- difficult in defining exposure
- lack of causal element (confounding exposure)
- limited by statistical significance

**Summary:** Workers occupationally exposed to benzene in 1940–49 were followed for vital status up to 1975. In comparison with two control populations, a significant ( $P < 0.002$ ) excess of leukæmia was observed. A five-fold excessive risk of all leukæmias and a ten-fold excess of deaths from myeloid and monocytic leukæmias combined are demonstrated in the study population compared with controls. These figures underestimate the true leukæmia risk to benzene-exposed workers, because follow-up is only 75% complete and the untraced 25% of the study population were all regarded, in the statistical analysis, as being alive at the end of the study period.

The environment of the workers in the study population was not contaminated with solvents other than benzene, and existing records indicate that the benzene levels themselves were generally below the limits recommended at the time of their measurement.

# Information for assessment

- **Animal experiment**

- **Advantage:**
  - **greatest control over exposure condition, exposed target characteristics, effect measured**

**Benzene: A Multipotential Carcinogen. Results of Long-Term Bioassays Performed at the Bologna Institute of Oncology**

Cesare Maltoni, MD, Barbara Comi, MD, and Giuliano Cotti, PhD

- **Disadvantage:**

- **uncertainty in extrapolation (species, dose, time frame)**

Until recently, the evidence of benzene carcinogenicity was based only on the association between benzene occupational exposure and human leukemia, with many limited case reports and scanty epidemiological data. Available experimental studies up to 1976 on animals were rare, fragmentary, and inadequate, and had failed to prove the carcinogenic effects of benzene. However, an integrated project of long-term carcinogenicity bioassays, begun in our laboratory in 1976 and still continuing, has shown that benzene produces a variety of tumors in rats including Zymbal gland carcinomas, carcinomas of the oral cavity, hepatocarcinomas, and possibly mammary carcinomas, lymphoreticular neoplasias, and other malignancies. Some of the tumors caused by benzene are uncommon or unusual in the breed of rats studied. Therefore benzene must be considered, under the studied experimental conditions, a strong multipotential carcinogen. The need for more experimental research is emphasized, particularly to assess the carcinogenic effects of low doses. Also recommended are more comprehensive epidemiological investigations, extended to all types of malignancies, and the application of adequate measures for primary prevention.

# Information for assessment

---

- **Controlled clinical exposures**

- Advantage:

- defined exposure and population, in human

- Disadvantage:

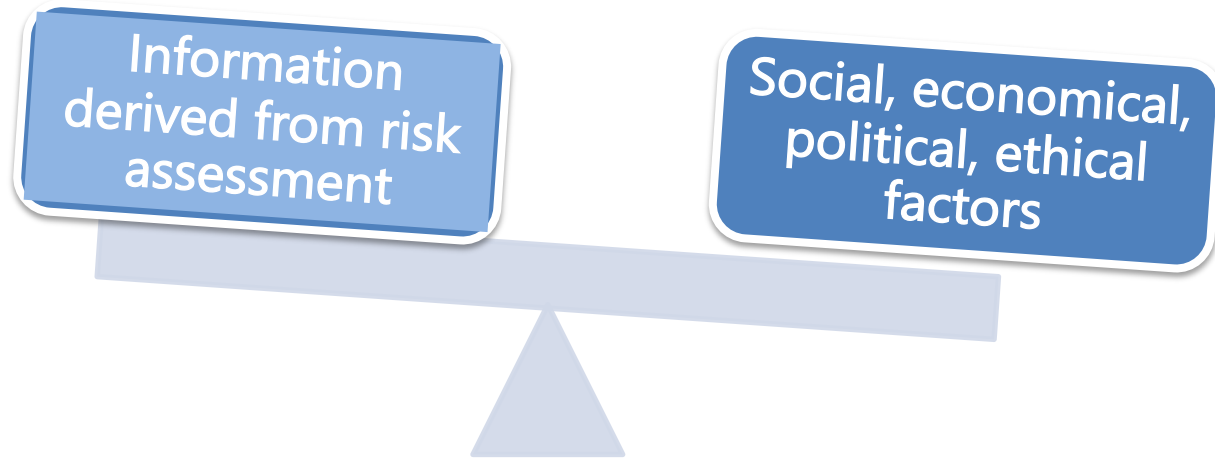

- Exposure at low concentration and short-term
    - Limit to small group and minor effect
    - Most susceptible group not appropriate for study

# Risk management

---

Process of identifying, evaluating, selecting, and implementing actions to reduce risk to human health and ecosystems.

Application in systemic toxicant

# Systemic Toxicant Evaluation

- Chemicals that are postulated to induce effect through a threshold mechanism

# Systemic Toxicant Evaluation

---

- Calculate exposure limit
  - Acceptable Daily Intake, ADI (mg/kg/day)
    - estimated (maximum) amount of an agent exposed over lifetime without **appreciable health risk** (also TDI, tolerable daily intake)
  - Risk reference dose, RfD
    - estimate of the daily exposure that is likely to be without **deleterious effects** even if continued exposure occurs over a lifetime.
  - ADI/RfD are derived from uncertainty factors (UF)

# Systemic Toxicant Evaluation

- Uncertainty factors

## U.S. EPA Guidelines for Development of RfD\*

<u>Extrapolation</u>	<u>Uncertainty Factor</u>
Animal to Human (H)	10
Average to Sensitive Human (S)	10
LOAEL to NOAEL (L)	10
Less than Chronic to Chronic (C)	10
Data Quality (MF)	1-10

# Systemic Toxicant Evaluation

---

- RfD calculation

$$\text{RfD} = \frac{\text{LOAEL or NOAEL}}{\text{UF}_1 \times \text{UF}_2 \times \text{UF}_n}$$

**Uncertainty  
involved**

LOAEL: lowest-observed-adverse-effect level

NOAEL: no-observed-adverse-effect level

**Exception:** multiple factors can yield unrealistically conservative RfDs

- 4 factors: 3000-fold UF
- 5 factors: 10,000-fold UF

# Systemic Toxicant Evaluation

- Example:

Insecticide: chlorpyrifos (CPS)

One-dose NOAEL in rat: 0.5 mg/kg

Chronic RfD in human?

$$\text{NOAEL (0.5)} / \text{UF}_H / \text{UF}_S / \text{UF}_C = 0.0005 \text{ mg/kg/day}$$

$$\text{RfD} = \frac{\text{LOAEL or NOAEL}}{\text{UF}_1 \times \text{UF}_2 \times \text{UF}_n}$$

Animal to Human (H)

Average to Sensitive Human (S)

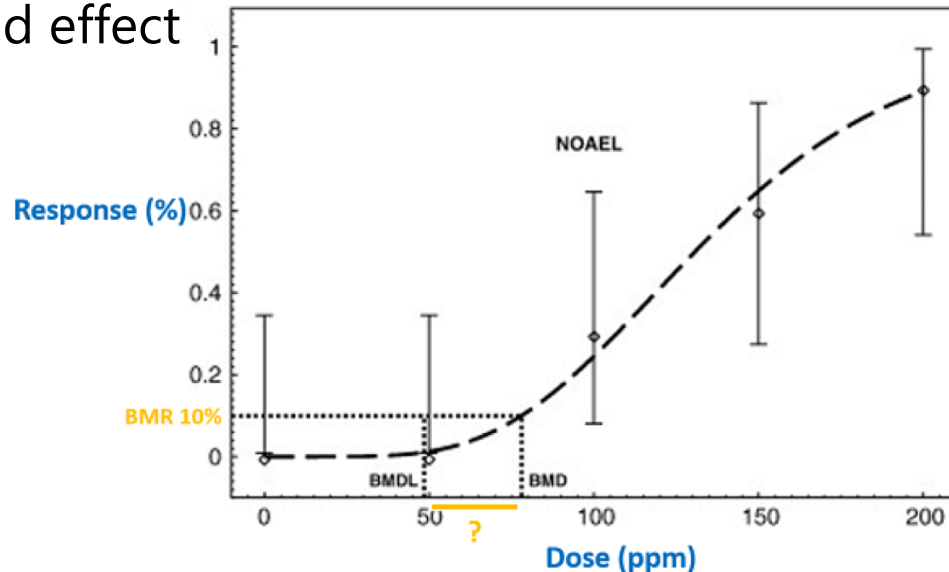

LOAEL to NOAEL (L)

Less than Chronic to Chronic (C)

Data Quality (MF)

# Systemic Toxicant Evaluation

- BMD
  - a dose or concentration that produces a predetermined change in the response rate of an adverse effect.
    - Alternative to RfD
    - Address experimental quality, shape of dose-response curve
    - Less dependant on study design
    - Threshold and non-threshold effect

Application in carcinogen

# Carcinogen Evaluation

- Carcinogenesis:
  - initiation, promotion, progression

Fig. 2 – Chemical carcinogenesis stages and the occurrences involved in each one.

# Carcinogen Evaluation

---

- **Carcinogen**
  - Classified according to their mode of action into genotoxic and non genotoxic.
  - Genotoxic: damage to DNA
  - Non-genotoxic: enhance growth of tumor
- **Dose-response relationship**
  - Threshold or non-threshold

# Carcinogenesis

## Decision Point Approach in Carcinogen Testing

- Carcinogenesis

Stage A. Structure of chemical

1. Possible electrophiles
2. Relation to known carcinogens

Stage B. Short-term genotoxicity assays

1. Bacterial mutagenesis; hepatocyte DNA repair
2. Other

*Decision Point 1: Evaluation of findings in stages A and B.*

Stage D. *In vivo* assays

1. DNA reactivity  
DNA damage assays
2. Limited bioassays  
Preneoplastic lesions (rat liver, mouse skin, mouse lung, rat breast)  
Transgenic mice

*Decision Point 3: Evaluation of results from stages A to C and selected tests in stage D*

Stage E. Carcinogenicity bioassays

1. Accelerated bioassays
2. Long-term bioassays

*Decision Point 4: Final evaluation of all results and cancer hazard assessment*

- Induction of cytochrome P450
- Peroxisome proliferation
- Hormone perturbation
- Gap junction protein downregulation
- Enhancement of preneoplastic lesions
- Immunosuppression
- Altered gene expression

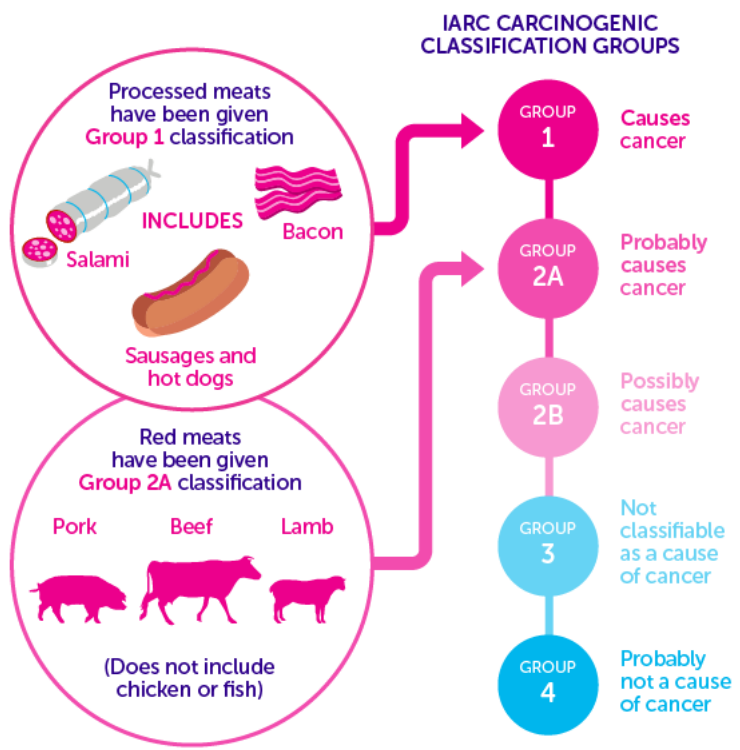

*Decision Point 2: Evaluation of results from stages A through C.*

# Classification Schemes for Carcinogens

## IARC Carcinogen Classification

GROUP	MEANING	AGENTS
<b>1</b>	Carcinogenic to humans	118 Includes tobacco, alcohol, and processed meat
<b>2A</b>	Probably carcinogenic to humans	75 Includes anabolic steroids, UV radiation, and red meat
<b>2B</b>	Possibly carcinogenic to humans	288 Includes coffee (urinary bladder) gasoline, and nickel
<b>3</b>	Not classifiable as to its carcinogenicity to humans	503 Includes caffeine, tea, and acrylic fibers,
<b>4</b>	Probably not carcinogenic to humans	1 Caprolactam: common synthetic polymer

## MEAT AND CANCER HOW STRONG IS THE EVIDENCE?

These categories represent how likely something is to cause cancer in humans, not how many cancers it causes.

# When applying assessment result to regulation

- High Risk Groups

## HOW MUCH MEAT DO YOU EAT A DAY?
